

The attached dataset contains events listed in the [Global Terrorism Database](#) between April 1, 2017 and May 14, 2017. What insights can you share with us about events that happened during this time period? We are interested in how you explore a new data set and work with free-form text data.

Complete this task in Python, ideally in a Jupyter notebook. You may use any packages you'd like. Write up all your findings either in the notebook or in a separate executive summary. When you are ready to submit, save your files to a GitHub repository and share the link with us.

Note:

- Be sure to show how you arrived at any conclusions, i.e. show your (coding) work.
- There is no need to use any external data sources besides this csv.
- Add comments about any work that you would have hoped to complete if you had more time.
